

SUMMARY

The Netflix Data Analysis Dashboard is an interactive business intelligence project developed using **Power BI** to analyse Netflix viewing patterns, customer engagement, ratings, and subscription trends. The project focuses on transforming raw entertainment data into meaningful insights through visually appealing and user-friendly dashboards. Multiple visualizations were created to study content performance across genres, countries, and subscription types.

The dashboard includes detailed analysis of watch time by age groups, ratings by genre, country-wise content distribution, and comparisons between Movies and TV Shows. Interactive filters and slicers allow users to explore the data efficiently and identify important trends. Various Power BI visuals such as bar charts, KPI cards, pie charts, and line graphs were used to make the analysis clear and informative.

This project helped improve skills in data cleaning, data transformation, dashboard development, and DAX calculations. It demonstrates how Power BI can be used to generate valuable business insights from large datasets and support better decision-making. The project also enhanced understanding of data visualization techniques and analytical reporting in real-world scenarios.
